

WEB DESIGN

TASK 3

LARA FITENI
DDN 4.2A

1. Without using screenshot of your code, explain how you have managed to build the basic layout and style of your website. Any deviations in layout and functionality from the original plan, as well as potential improvements to your final work must be discussed.

In my website that I had created I have 5 HTML files with a CSS file. The first step that I did was the navigation bar in my index.html file, I build it by input the nav code and inside the nav I put a div and in the div I created a class for the style that I use in CSS, from line 14-35 in html and from line 2-56 in CSS for the navigation bar, I repeated this step in other HTML files to have the same navigation bar.

For the footer I did the same for all HTML files, first I created a footer in index.html file and inside the footer I inserted 4 div to create my footer, I did 2 classes in my html file and continued in my CSS file for the design. On the index.html file you can find this code line 51-74 and in the CSS from line 189-207. I copy the step to all HTML file.

And I created an image line 41 with a class in CSS and a quote line 43 – 49 with a class in CSS line 58 -64

Aboutme.html

In the about me page I created a blue background which I found on the internet and 2 boxes inside it, one with the text and the other with an image.

I created a div and inside this div I put 2 other div, one for the text and the other to put the image. From line 38-49, after I created 2 different classes one I named it box1 and the other box 2 and then I completed to design in the CSS file from line 75-97.

Myblog.html

Here I put more text and more images, my first step was that I put an image on top of the website line 36 after I put an h3 for the title line 39 and gave it a class for its design and after I put paragraphs line 40-52 after the text I decided to put other 2 images besides each other, lines 54-55 and I gave them two different classes in CSS line 110-121 to arrange there width, height and to move them around after I did another small paragraph with using <p>.

Myartickle.html

Beside the nav and footer which I explain in the index.html, here I put an image on half and the other half all text, here I created 3 different div one for the image and the other for the text line 37-59, and a class for them in CSS line 127-138

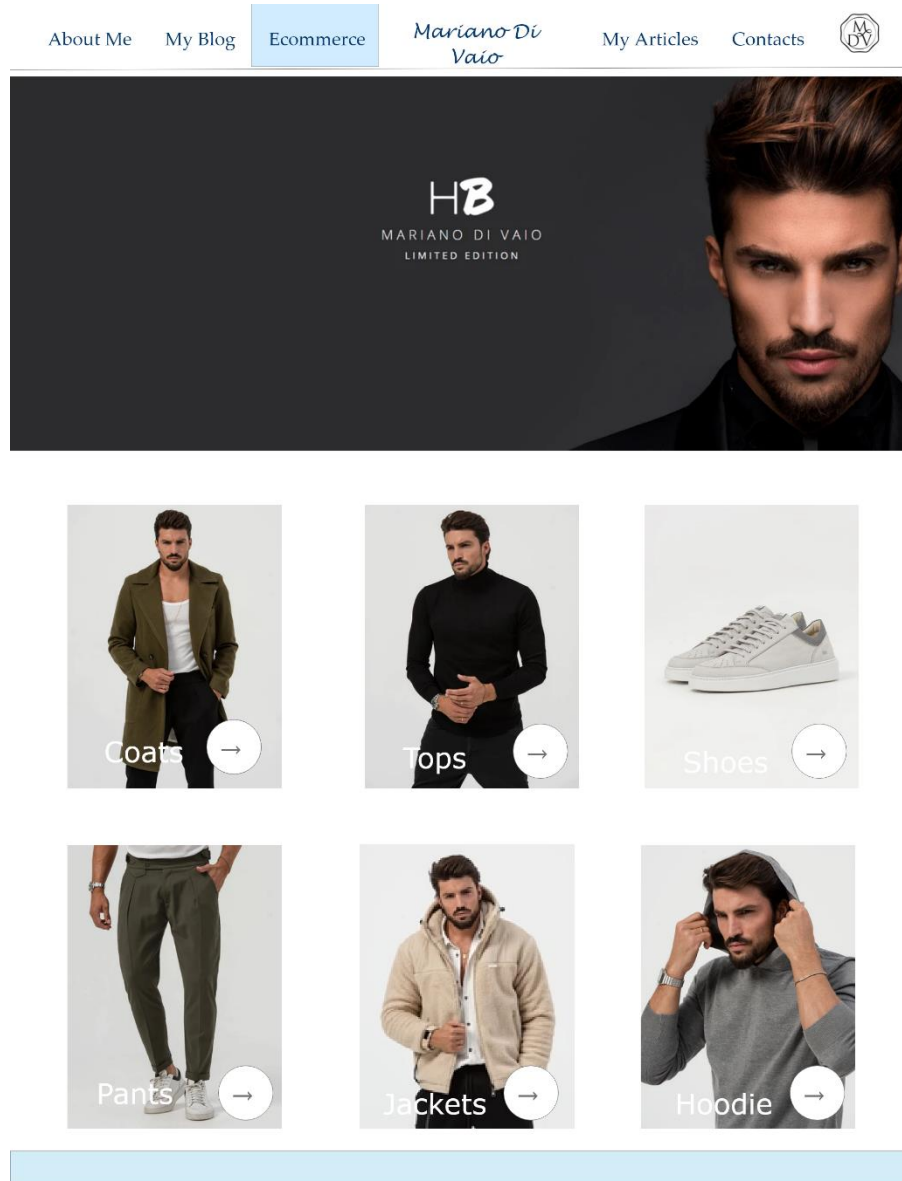

Contactme.html

In my contact me page a created a contact form and above it an image. Line 37 for the image and line 39 – 92 for the whole contact form. I created a lot of div with different classes to arrange their design in CSS file, line 142 – 186.

I enjoyed doing my website I kept it simple because I know that I am a beginner I need to improve more by practice to do a more creative website in the future.

2. Select TWO from the following list of internet services and discuss what changes could be applied to your website to add dynamic content to your pages. You are encouraged to create visual mock-ups that will help give context to your explanation.

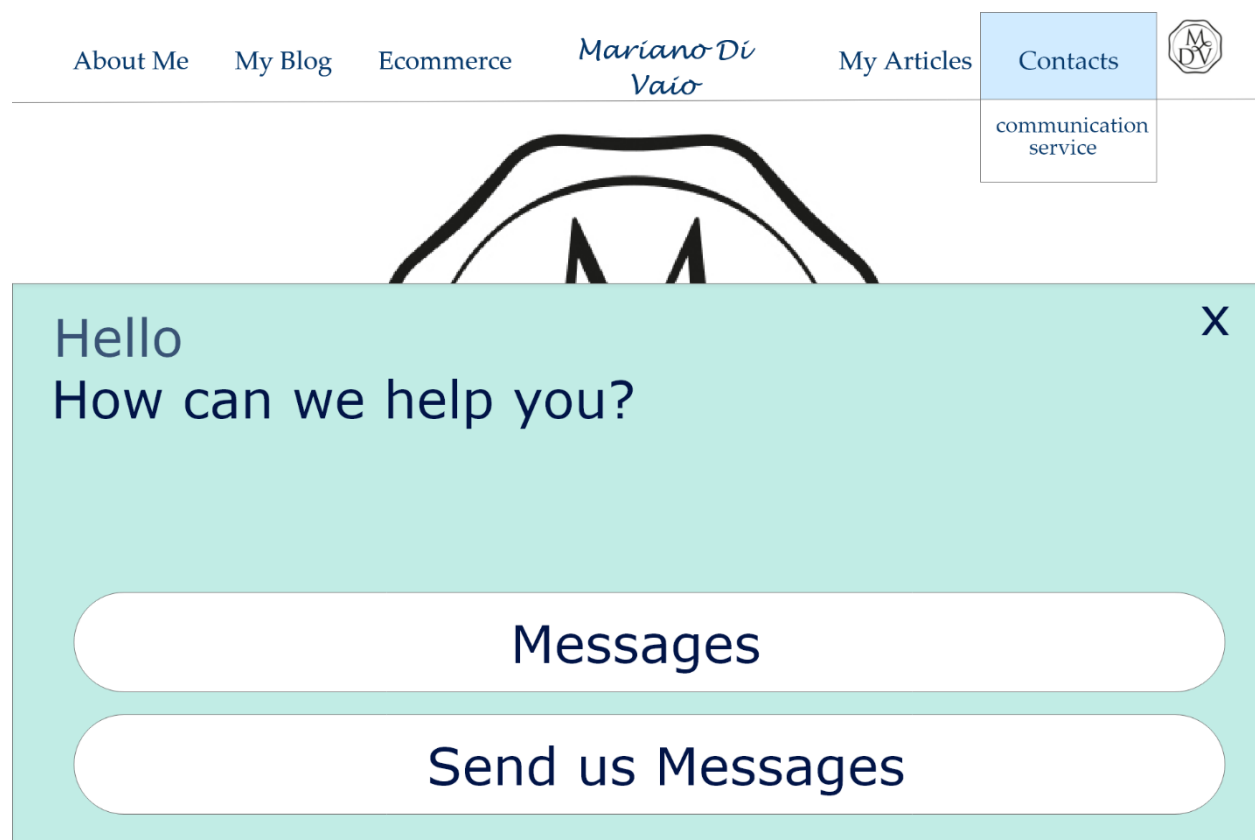

Ecommerce

Ecommerce is a process of buying or selling a product or service over an electronic systems such as the internet. it is an electronic marketing. It helps to increase customer reach.

I will be adding another page to my website as a separate page. Ecommerce website is important because it can sell goods and service from anywhere in the world and it can be always accessible. Customers can visit online store and choose up whatever they want any time of the day and night.

Communication service

Communication service is when you are communicating with other people,

I will be adding Communication service under the contact page, when someone hover on the contact page a small pop up comes out Undernet it, the contact page its like a contact form and communication service is a fast service that someone can message directly and a customer person will reply as soon as possible.
